

IN THE SPECIFICATION

On page 9, the paragraph starting on line 1 and ending on line 11, is replaced as follows:

--Referring to Figure 2, the smart camera system of the present invention 50 integrates an acquisition sensor of the camera 22 or frame grabber module 24, a pipeline pre-processor 26, and an image analyzer processor 28 of the prior art into a single smart camera box 60. Required bandwidth is minimized since only detected flaws and defects of the inspection and corresponding flaw position information are communicated to the host computer 58 through ethernet outputs 64 to an ethernet hub 62. Thus, off-the-shelf ethernet cables 64 may be utilized between the smart cameras 60 of the present invention and an ethernet hub 62.--

IN THE CLAIMS

A clean version of claims 1-9 after amendment are shown below with claims 1-8 amended as follows:

1. (amended once) A web inspection system for detecting a plurality of web flaws of a web, the web inspection system comprising:
2 a plurality of smart cameras for generating a digital pixel representation of a portion of the web, each smart camera for detecting the plurality of web flaws from the digital pixel representation and for generating flaw
4 image data and flaw location data;
6 a host computer for controlling the web inspection system and for receiving
8 and displaying the flaw image data and the flaw location data; and
10 an ethernet for connecting the plurality of smart cameras to the host compute, wherein the flaw image data and the flaw location data is transmitted over the ethernet from the plurality of smart cameras to

12 the host computer.

2. (amended once) The web inspection system of claim 1, wherein each smart
2 camera of the plurality of smart cameras comprises:

4 a line scan camera for generating the digital pixel representation of a portion
of the web;

6 a lighting uniformity and pixel sensitivity correction means for correcting each
pixel of the digital pixel representation and for providing a corrected
pixel representation;

8 a web edge detector for detecting at least one edge of the web;

10 a multi-pipeline pre-processor for filtering the corrected pixel representation,
the multi-pipeline preprocessor generating a prioritized data stream
of potential flaws;

12 a run length encoder for generating location data regarding a location of
each group of the potential flaws in a cross direction;

14 a blob detector for generating block data regarding the location of blocks of
the potential flaws along a machine direction; and

16 an inspect/reject analyzer for determining actual flaw data from the
prioritized data stream of potential flaws.

3. (amended once) The web inspection system of claim 2, wherein the multi-pipeline
2 processor comprises:

4 a plurality of filters for averaging the corrected pixel representation over a
distance of the web along a machine direction of the web;

6 a plurality of adaptive background subtraction channels connected to the
plurality of filters, each adaptive background subtraction channel of
the plurality of adaptive background subtraction channels producing
8 a stream of subtracted pixel representations;

a plurality of thresholders, each thresholder of the plurality of thresholders
10 connected to an output of an adaptive background subtraction channel of the plurality of adaptive background subtraction channels,
12 each thresholder for grouping at least a portion of the stream of subtracted pixel representations and for producing an thresholder
14 group output; and
16 a priority logic circuit for prioritizing the thresholder group output of each of the plurality of thresholders.

Cut
b1

4. (amended once) The web inspection system of claim 3, wherein the plurality of
2 filters comprises:

4 a background filter;
6 a machine direction streak filter;
a cross direction streak filter; and
a small flaw filter.

5. (amended once) The web inspection system of claim 3, wherein the plurality of
2 thresholders comprises:

4 a single pixel flaw detector;
6 a uniformity detector;
a machine direction streak detector;
a cross direction streak detector; and
a small flaw detector.

6. (amended once) The web inspection system of claim 1, wherein each smart
2 camera of the plurality of smart cameras detects the plurality of web flaws from the
the digital pixel representation at a contrast approaching a signal noise level.

7. (amended once) A method for low contrast web inspection of a web, the method
2 comprising the steps of:

providing at least one smart camera for inspecting at least a portion of the
4 web, wherein inspecting at least a portion of the web comprises the
steps of;

6 generating flaw image data and flaw location data of the at least a
portion of the web; and

8 transmitting the flaw image data and flaw location data over an
ethernet to a host computer; and

10 displaying the flaw image data and flaw location data on the host computer.

8. (amended once) The method of claim 7, wherein the step of generating flaw
2 image data and flaw location data comprises the steps of:

generating a pixel representation of the at least a portion of the web;

4 correcting the pixel representation for a lighting uniformity and a pixel
sensitivity;

6 filtering the corrected pixel representation utilizing a plurality of filters;

8 grouping the filtered corrected pixel representations to generate a plurality
of potential flaw data streams;

10 generating a prioritized data stream from the plurality of potential flaw data
streams;

12 generating cross direction location data regarding a location of the prioritized
data stream;

14 generating block data regarding the location of blocks of the prioritized data
stream along a machine direction; and

16 determining actual flaw data from the prioritized data stream of potential
flaws utilizing the cross direction location data and the block data.

9. A method for generating a prioritized image data stream from a digitized video stream of a web, the method comprising the steps:

2 averaging the digitized video stream over a distance of the web to generate
4 an averaged background signal;

6 averaging the digitized video stream over a distance of the web along a
 machine direction of the web to generate a filtered machine direction
 signal ;

8 averaging the digitized video stream over a distance of the web along a
 cross direction of the web to generate a filtered cross direction signal;

10 subtracting the averaged background signal from the filtered machine
 direction signal to generate a first pixel representation;

12 subtracting the averaged background signal from the filtered cross direction
 signal to generate a second pixel representation;

14 grouping the first and second pixel representations to generate at least two
 data streams of potential flaws; and

16 prioritizing the at least two data streams of potential flaws to generate the
 prioritized image data stream.
